

Determining a Method to Reduce Imports Spending

Problem Statement:

Imports Spending in 2025 Was Up 5% From 2024. Need to Find a Potential Way to Reduce Spending While Maintaining Purchase Quantities.

To address this need 3 things:

- 1) Find the highest imported goods by quantity and price
- 2) Determine if there are alternative sources for the highest of these goods within the data that offer a cheaper price
- 3) If found, project potential savings to be made when switching to this source

Objective 1:

Find Top 3 Most Imported
Goods by Price and Quantity

The most imported good by price for the last three years was iron ores

The most imported good by quantity for the last three years was also iron ores

Objective 2:

Determine if there are alternate sources

Comparison of Alternate Sources for Non-Agglomerated Iron Ores And Concentrates

Objective 3:

Determine potential savings if alternate sources are used

Potential savings of \$5.7 Million
if switching all non-Brazil
sourced iron ores

Recommendation:

Switch to sourcing more iron ores from Brazil

Appendix:

Most imports for iron ores are already done from Brazil

Total Import Quantity for Non-Agglomerated Iron Ores And Concentrates From Each Source Per Year

The Highest Total Import Quantity For Each Year is from Brazil
Country
